1.INTRODUCTION:

In the last recent years, job recommender systems have become popular since they successfully reduce information overload by generating personalized job suggestions. Although in the literature exists a variety of techniques and strategies used as part of job recommender systems, most of them fail to recommending the job vacancies that fit properly to the job seekers profiles. Thus, the contributions of this work are three fold, we:

- i) Made publicly available a new dataset formed by a set of job seekers profiles and a set of job vacancies collected from different job search engine sites.
- ii) Put forward the proposal of a framework for job recommendation based on professional skills of job seekers.
- iii) Carried out an evaluation to quantify empirically the recommendation abilities of two state-of-the-art methods, considering different configurations, within the proposed framework. We thus present a general panorama of job recommendation task aiming to facilitate research and real-world application design regarding this important issue.

1.1.Project overview:

A number of postings for different job roles and job positions are posted at numerous sources in the recruitment industry. Therefore, this is a challenging and time -consuming task to collate the information and find out most relevant user-job connection mapping according to the skills and job preferences of a user. This research work has been done to cover up this same problem and efforts have been made to provide a feasible and efficient solution for the same. We suggest a content-based recommendation system, which automatically provides best suggestions to users by matching their interests and skills with the features of a job posting. In order to produce an intended recommendation, the proposed to applying that various text filters and feature similarity measurements. Similarity techniques use the bag of n-grams and topic models as the elements of feature vectors. The validations and testing of the model on real data obtained from a top job portal website show the applicability and efficiency of using topic models as features. The approach is generic and can be replicated to different techniques.

1.2.Purpose:

Skill sets complement AQF qualifications. Skill sets benefit the students by giving them:

- i. Training pathways to AQF qualification.
- ii. Specific skills and general capabilities.
- iii. More career opportunities within their workplace and between employers.

In the immediate term, skill sets are a means of re-skilling that can help Victorians respond to a rapidly changing post-COVID-19 economy and job market.

Specific purpose job description includes detailed information about job responsibilities of an employee. It also covers sub tasks, essential

functions and detailed job duties. It involves huge amounts of details such as what an employee needs to do, how it is to be done and what are the performance standards,

A career purpose creates a sense of meaning, like you're on a mission to do something worthy. It integrates who you are with what you do, and connects it to the impact you want to make on this world. Knowing your WHY provides a filter through which you can make decisions, every day, to act with purpose.

2.LITERATURE SURVEY:

The Internet-based recruiting platforms become a primary recruitment channel in most companies. While such platforms decrease the recruitment time and advertisement cost, they suffer from an inappropriateness of traditional information retrieval techniques like the Boolean search methods. Consequently, a vast amounting of candidates missed the opportunity of recruiting. The recommender system technology aims to help users in finding items that match their personnel interests; it has a successful usage in e-commerce applications to deal with problems related to information overload efficiently. In order to improve the e-recruiting functionality, many recommending system approaches have been proposed. This article will present a survey of e-recruiting process and existing recommendation approaches for building personalized recommender systems for candidates/job matching.

The significance of Information System (IS) support in the recruitment process can be observed when considering the phases of the recruitment such as the handling of candidates" applications and the pre-selection of candidates. However, a best fit between job and candidates depends on

underlying aspects that are hard to measure. These underlying aspects are a significant reason why information systems have not been extensively used in the area of personnel selection so far. Mostly, IS technology is used to pre-select applicants based on Boolean search method. This method used queries contain a combination of key words that define skill requirements in order to determine those candidates that match with search criteria. Such type). The recommender systems techniques can be used to address the problem of information overload by prioritize the delivery of information for individual users based on their learned preferences (Lee and Brusilovsky, 2007). Additionally, the success of personalization technologies depends critically on the existence of comprehensive user profiles that precisely capture users' interests (Rafter and Smyth, 2001) and the perfect matching method. Moreover, the recommender systems could use historical rating information to determine which type of job required which type of candidate characteristics in the past in order to be rated positively by the recruiter. This information could then be used to predict the match between job and previously not rated candidates. The need of applying the recommender system techniques for selection process can be motivated from different perspectives. While we interested in how people find an appropriate job, other researchers are interested in how change the ways people effectively collaborate once the candidate is recruited. of skill matching is applied in numerous e-recruiting applications. However, as mentioned above, the simple filter techniques such as Boolean search method cannot be sufficient to realize the complexity of a person-job fit as selection decisions often depend on underlying attributes such as personal characteristics or social skills that cannot be put into an operational way easily (Malinowski et al., 2006).

Additionally, the need to understand the job requirements, in terms of the skills that are mandatory and those that are optional but preferable, the experience criteria if any, preference for the location of the candidate etc. Consequently, the major challenge faced e-recruiting applications as identified by the literature analysis is the large number of low qualification of applicants that match the search criteria (Singh et al., 2010). This increases the requirements to select candidates that not only fit with the requirements of the job but also with the team members in terms of interpersonal compatibility (Malinowski et al., 2006).

2.1 Existing problem:

- A significant problem for labour market policies relies on the individual of the most advisable skills to have and to enhance through focused training offers.
- Vocational training system and institution are called to answer the question posed by every person looking for a new job.
- Recommendation system is based on the job ads published by Italian companies on various websites for both 2019 and 2020 after the skills required for each job offer have been mapped to one of the skills presented in the classification of European Skills/competence, qualifications and Occupations (ESCO).

2.3 Problem statement definition:

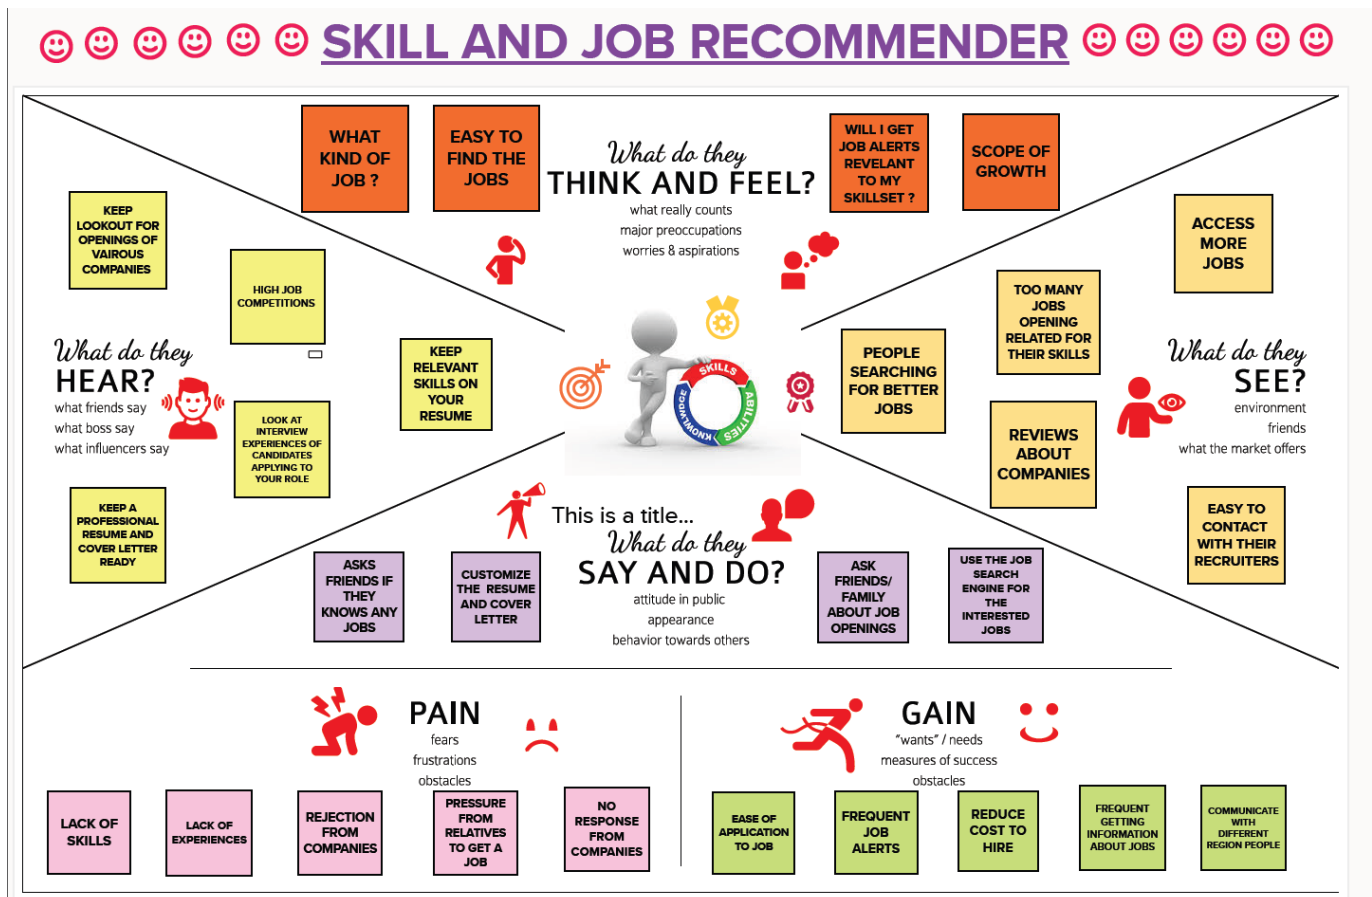

The dataset used for this research are sourced from Stack overflow survey data which is modelled as the user data for this research. Another dataset was created by web scrapping the Job board Using R programming language to fulfill the road map of this dissertation. The research question proposed by this research is "Can an efficient recommender system be modeled for the Job seekers which recommend Jobs with the user's skill set and job domain and also addresses the issue of cold start?". To answer the research question, below are the objectives that need to be satisfied with going forward.

3.IDEATION & PROPOSED SOLUTION:

In the Ideation stage, design thinkers spark off ideas in the form of questions and solutions through creative Ideation is at the heart of the Design Thinking process. There are literally hundreds of ideation techniques, for example brainstorming, sketching, empathy map, SCAMPER and prototyping. Some techniques are merely renamed or slightly adapted versions of more foundational techniques, and curious activities such as Brainstorms and Worst Possible Idea. In this article, we'll introduce you to some of the best Ideation methods and guidelines that help facilitate successful Ideation sessions and encourage active participation from members.

When facilitated in a successful way, Ideation is an exciting process. The goal is to generate a large number of ideas ideas that potentially inspire newer, better ideas that the team can then cut down into the best, most practical and innovative ones.

3.1 Empathy Map Canvas:

[illegible]

3.3 Proposed Solution:

Proposed Solution Parameter and its Descriptions:

1. **Problem Statement (Problem to be Solved):**

- Recruiters also get the recommendations about the seekers based on the skills requirements.
- Premium policy is an issues to the users.
- Estimating salaries based on technical skills.

2. **Idea / Solution Description:**

- Free access to every user's.
- Recruiters can post for the job openings in our applications.
- Provide job description to the job seekers.

3. **Novelty / Uniqueness:**

- Job seekers will be able to communicate through chat box and our application is user friendly and the structure is simple.
- Earnings estimator based on knowledge of users.

4. **Social Impact / Customer Satisfaction:**

- Open doors for every users as there is free access.
- Users stay up to date of the offers.

5. **Business Model (Revenue Model):**

- Regularly updating the new technologies and jobs offers.
- Advertisements, Database Selling, Premium Content, Affiliate Marketing and Email Sales.

6. **Scalability of the Solution:**

- Easy navigation and user-friendly interfaces.
- Creating a positive culture is the main cause in maximizing the

productivity.

3.4 Problem Solution Fit:

1.Customer segment:

- Job seekers who are looking for job opportunity as a fresher and looking for better job than his current job.
- Recruiters who are looking to hire a valuable candidate for their company.

2.Job to be done/problems:

- Premium policy in the existing solution makes the users to feel that being out of the game.
- Lot of mixed set of information's makes the users to feel their search as a hindrance.
- Spam is one of the flows in the existing solutions that has become more and more common in recent years.

3.Triggers:

- An event that causes a buyer to have a clear need.
- This might have caused you to browse the web reading various reviews.
- Time savings and Job alerts.

4.Emotion:

- Before:
 1. Stressed
 2. Unsatisfaction
- After:
 1. Quick result
 2. Up to Date information

5.Available solution:

- Daily Job Alerts
- Hiring Workflow
- Finding Best Match Candidate
- Fegregation of job field

6.Customer constraints:

- Network Connectivity
- Groups of information
- Possibility of scams
- Operating Systems
- Subscription reduces opportunity

7.Behaviour:

"Job" is shorthand for what an individual really seeks to accomplish in a

given circumstance. The circumstances are more important than customer characteristics, product attributes new technologies, or trends.

8.Channels of behaviour:

- **ONLINE:**

1. It is all about taking care of your customers.
2. Maintaining a great customer experience does more than benefits your customers.

- **OUTLINE:**

- 1.The offline media channels for advertising includes television ads billboards radio, telemarketing, pamphlets and any other kind of print media.
2. Final round of interview process Certificate verification.

9. Problem root cause:

- Fake profile which seeks money and people.
- Personal information collected by recommends raises the risk unwanted exposure of information
- Spam messages, which range from unsuitable proposals due to a lack of research or automatically generated messages.

10.Your solution:

To develop an application that helps users to overcome their difficulty to search for jobs. Overcoming the hurdles faced by the users in the existing solutions.

4.REQUIREMENT ANALYSIS:

4.1 Functional Requirements:

- **User Registration** - Registration through Web Application, Mobile Number, Gmail ID.
- **User Accessibility** - The users need to enable location, storage, media allowance.
- **User Profile** - The users have to create a profile which has some basic information relevant to the application.
- **User Uploads** - The users have to upload the softcopy of their mark sheet, identity card and resume of their original database.
- **User Verification** - The user has to verify whether the given information is correct or not.
- **End User Benefits** - This makes the recruit process in an easy manner. It helps us to know the educational information in an effective way.

4.2 Non-Functional Requirements:

- **USABITILIY** - It is effective way to achieve the skill and job recommendation. It is easily access by everyone.
- **Security** - The privacy of the users should be guaranteed in the system.

- **Reliability** - Integrity and consistency of the recommender engine and all its transactions should be ensured.
- **Performance** - The recommender engine should generate recommendation within a time frame of 500 milliseconds.
- **Availability** - It is always available in all platforms through websites.
- **Scalability** - It may convenient for the user to use the application and also this app have been considered as user friendly.
- **Learnability** - A new user should be able to use the recommender engine without putting too much efforts on learning how to use it, and in case of doubt, there must be some help to solve their doubts.

5.PROJECT DESIGN:

A project design of skill job recommender application. recommender is an extensive class of web application that involves predicting the user response to the option.

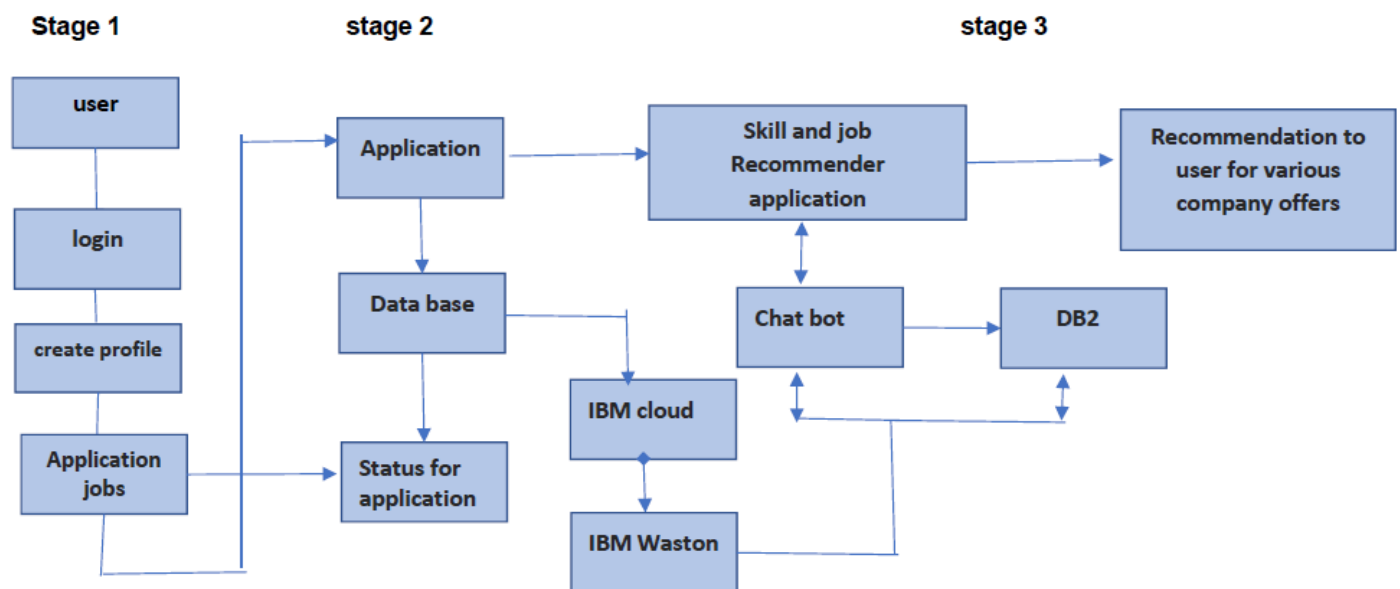

Often termed as recommender system they are simple algorithms which aim to provide the most relevant and accurate items to the user by filtering useful information base.

In real time examples are like amazon, they have been using a recommendation engine for suggesting the goods or product that customer might also like.

Although machine learning commonly used in building recommendation system, it doesn't mean it's the only solution. There are many

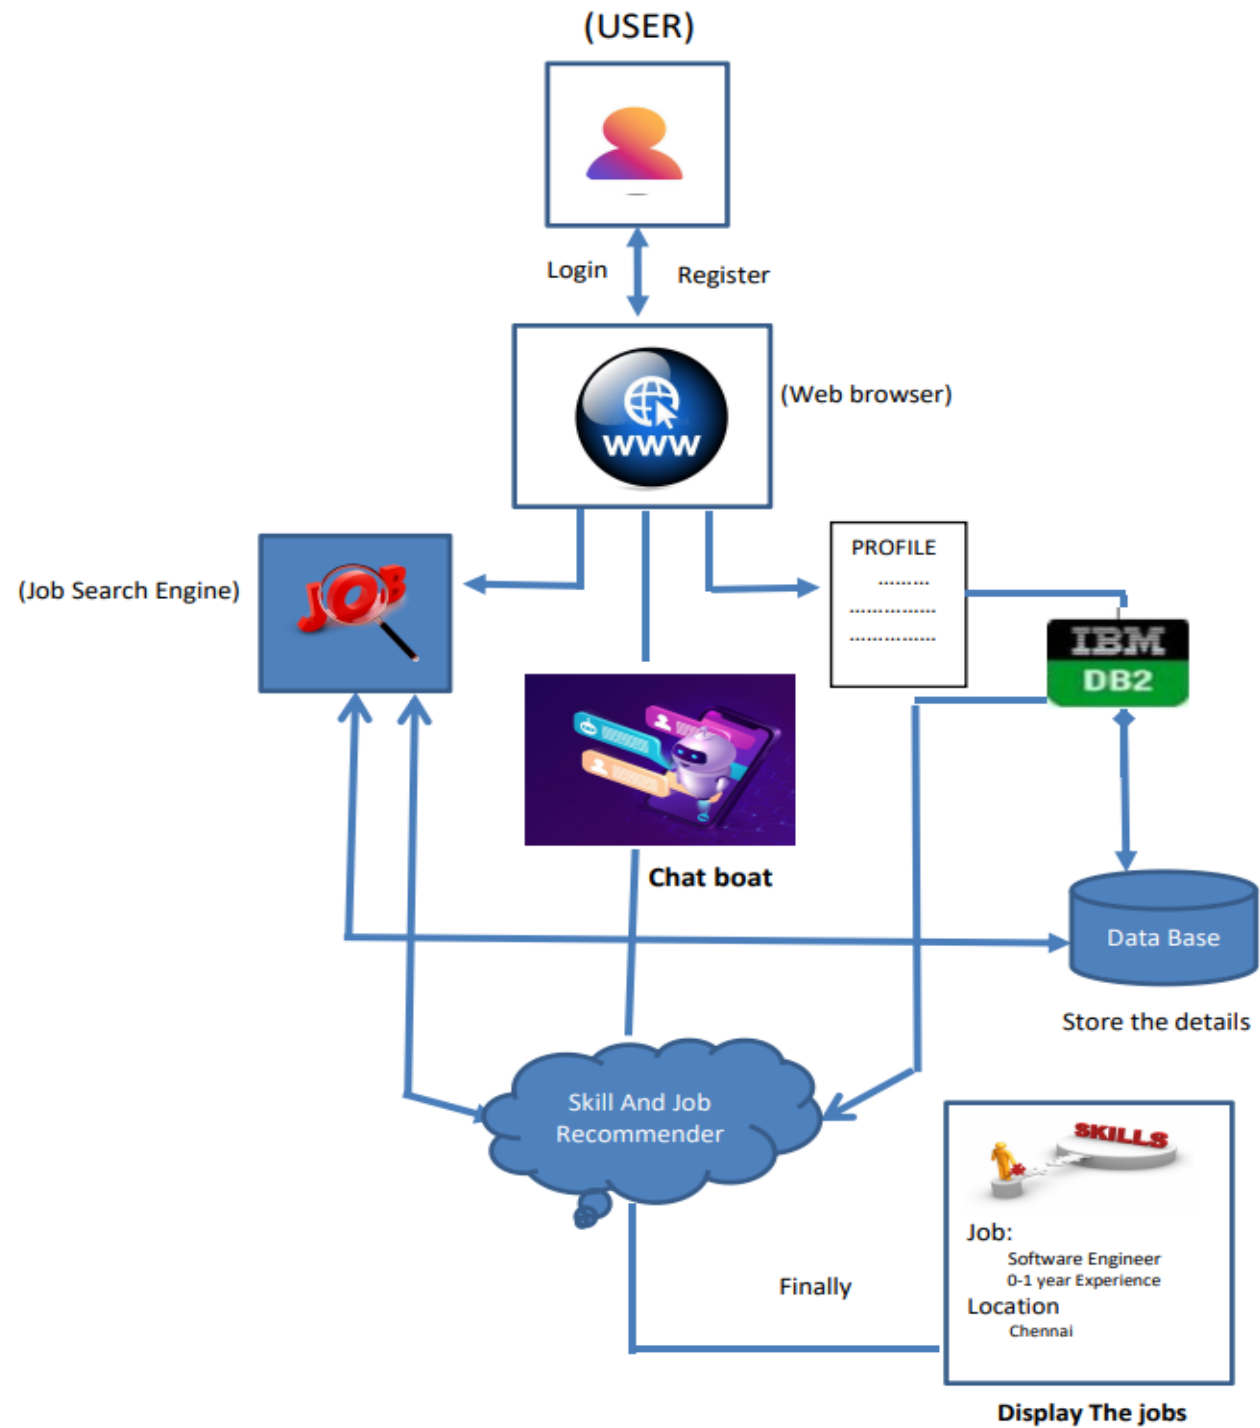

ways to build recommendation system.

5.1 Data Flow Diagrams:

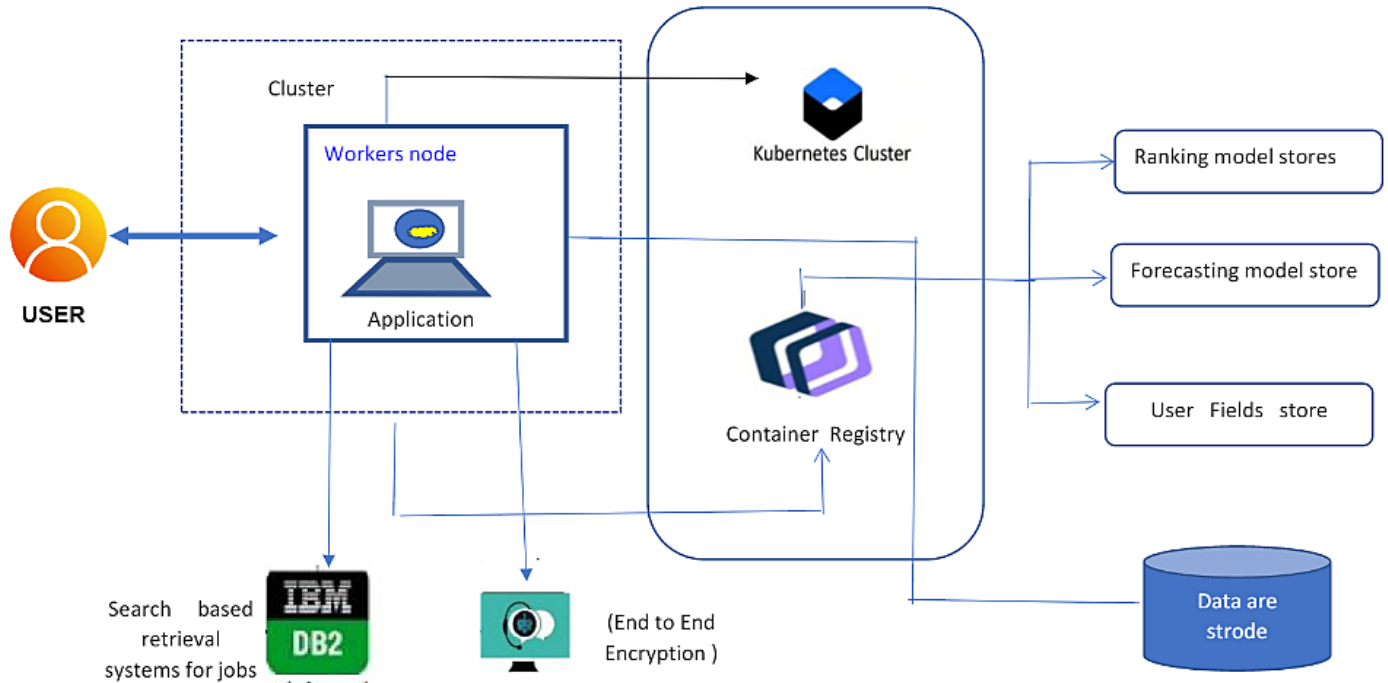

5.2 Solution & Technical Architecture:

Solution Architecture:

Technical Architecture:

5.3 User Stories:

1. As a user, I can register for the application by entering my email, password, and confirming my password.
2. As a user, I can log into the application by entering email & password.
3. As a user, I can log into the application after conforming the email & password
4. As a user, I can ask the Chat bot about latest job openings, which will help me and show the recent job openings based on my profile.
5. As a user, I can access the website in a second.
6. As a user, If I Logged in correctly, I can view my dashboard and I can navigate to any pages which are already listed there.
7. As a user, I can visit the online job portal and learning platforms.
8. As a user, I can register the job through the applications.
9. As a user, I can ask queries about the job information.
10. As a user, I can access the website without any interruption.
11. As a user, I can access the website without any interruption.

6.PROJECT PLANNING & SCHEDULING:

6.1 sprint planning & estimation:

Sprint Delivery planning:

Sprint	Functional Requirement (Epic)	User Story Number	User Story / Task	Acceptance criteria	Priority	Team Members
Sprint-1	Registration	USN-1	As a user, I can register for the application by entering my email, password, and confirming my password.	I can access my account / dashboard	High	KARTHIGA UDHAYA SANGEETHA
Sprint-1		USN-2	As a user, I will receive confirmation email once I have registered for the application	I can receive confirmation email & click confirm	High	KARTHIGA
Sprint-2		USN-3	As a user, I can register for the application through Facebook.	I can register & access the dashboard with Facebook Login	Low	KARTHIGA AARTHI UDHAYA
Sprint-3		USN-4	As a user, I can register for the application through Gmail	I can receive confirmation email & click confirm	Medium	KARTHIGA
Sprint-2	Login	USN-5	As a user, I can log into the application by entering email & password	I can access my account / dashboard	High	UDHAYA
Sprint-2	Dashboard	USN-6	Create a model set that contains those models, then assign it to a role.	Assign that group to the appropriate roles on the Roles page	High	KARTHIGA UDHAYA SANGEETHA
Sprint-4	Identity-Aware	USN-7	Open, public access, User-authenticated access, Employee-restricted access.	Company public website. App running on the company intranet. App with access to customer private information.	High	KARTHIGA SANGEETHA UDHAYA AARTHI
Sprint-1	Communication	USN-8	A customer care executive is a professional responsible for communicating the how's and why's regarding service expectations within a company.	For how to tackle customer queries.	Medium	KARTHIGA UDHAYA AARTHI SANGEETHA
Sprint-3	Device management	USN-9	You can Delete/Disable/Enable devices in Azure Active Directory but you cannot Add/Remove Users in the directory.	Ease of use.	Medium	KARTHIGA UDHAYA SANGEETHA AARTHI

6.2 sprint delivery schedule:

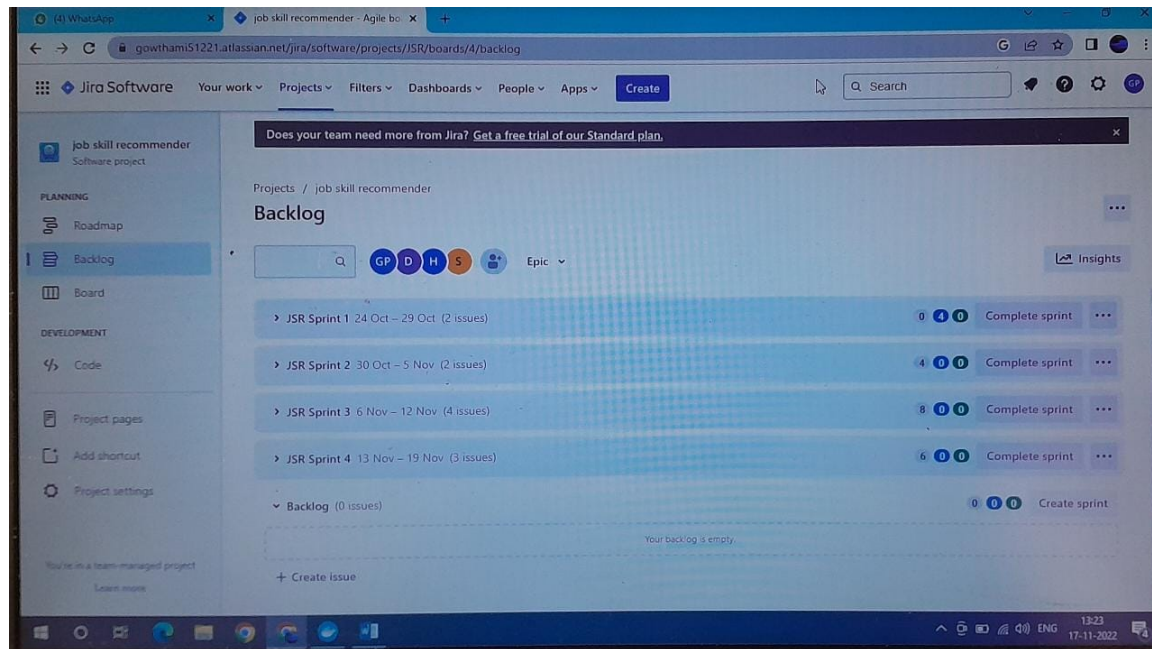

Total Story Points	Duration	Sprint Start Date	Sprint End Date (Planned)	Story Points Completed (as on Planned End Date)	Sprint Release Date (Actual)
20	7 Days	24 Oct 2022	29 Oct 2022	20	29 Oct 2022
20	7 Days	30 Oct 2022	05 Nov 2022	20	05 Nov 2022
20	7 Days	06 Nov 2022	12 Nov 2022	20	12 Nov 2022
20	7 Days	13 Nov 2022	19 Nov 2022	20	19 Nov 2022

8.2 User acceptance testing:

Test Cases ID	Feature Type	Components	Test Scenario
TC01	functional	home page	verify user is able to see the login/signin popup when user clicked on my account button
TC02	UI	home page	verify the UI elements in login/signin popup
TC03	functional	home page	verify user is able to log into application with valid credentials
TC04	functional	application	verify user is able to job application form
TC05	functional	contact	verify user is able to customer comment system
TC06	functional	chatbot	verify user is able to customer help system

Test Case ID	Pre-Requisite	Steps To Execute	Test Date
TC01		1.enter URL and click go 2.click on my account dropdown 3.verify login/signin popup displayed or not	https://gowmi12.s3.jptok.cloud-objectstorage.appdomain.cloud/first%20page.html
TC02		1.enter URL and click go 2.click on my account dropdown 3.verify login/signin popup with UI elements: a .email text box b. password text box c. login button d. new customer? create account link e. last password? recovery password link	https://gowmi12.s3.jptok.cloud-objectstorage.appdomain.cloud/first%20page.html
TC03		1.enter URL(https://gowmi12.s3.jptok.cloud-object-storage.appdomain.cloud/first%20page.html) and click go 2.click on my account dropdown button 3.enter valid username/email in email text box 4.enter valid password in password text box	username: example@gmail.com password:@example
TC04		1.press the register button 2.start to fill the form 3.enter your name and details placed in at the place in text box 4..enter valid username/email in email text box 5.enter valid password in password text box	username: example@gmail.com password:@example
TC05		1.press the contact button 2.start to fill the form 3.enter your name and details placed in at the place in text box 4.enter valid username/email in email text box 5.enter your comments about in the application	username: example@gmail.com password:@example
TC06		1.you first finish the login/signin popup 2.you have to see in right side bottom corner in enable to chat bot 3.you did to ask in application related questions in chat bot	you start with hii

Test Case ID	Actual Result	Result	BUG ID
TC01	working as expected	pass	
TC02	working as expected	pass	
TC03	working as expected	pass	
TC04	working as expected	pass	
TC05	working as expected	pass	
TC06	working as expected	pass	

9.RESULT:

9.1 Performance metrics:

At its most basic, a performance evaluation is simply providing constructive feedback on whether an employee is underperforming, meeting, or exceeding the goals and objectives of their job. Employees need this feedback so they can feel confident knowing what is expected of them as well as how and where they can improve.

- CPU usage.CPU usage affects the responsiveness of an application.
- Memory usage.
- Requests per minute and bytes per request.
- Latency and uptime.
- Average response time
- Error rates.

10.ADVANTAGES & DISADVANTAGES:

ADVANTAGES:

- The model doesn't need any data about other users, since the recommendations are specific to this user. This makes it easier to scale to a large number of users.
- The model can capture the specific interests of a user, and can recommend niche items that very few other users are interested in.

DISADVANTAGES:

- Since the feature representation of the items are hand-engineered to some extent, this technique requires a lot of domain knowledge. Therefore, the model can only be as good as the hand-engineered features.
- The model can only make recommendations based on existing interests of the user. In other words, the model has limited ability to expand on the users' existing interests.

11.CONCLUSION:

In this conclusion, we used a literature analysis of many journals and proceedings related to the requiring process and the job recommendation researches. We have seen from our literature review and from the challenges that faced the holistic e-requiring platforms, an increased need for enhancing the quality of candidates/job matching. The recommender system technologies accomplished significant success in a broad range of applications and potentially a powerful searching and recommending techniques Consequently is a great opportunity for

applying these technologies in environment to improve the matching quality. This survey shows that several approaches for job recommendation have been proposed, an many techniques combined in order to produce the best fit between jobs and candidates. We presented state of the job recommendation as well as a comparative study for its approaches that proposed by literatures. Additionally, we reviewed typical recommender system techniques and the recruiting process related issues. We conclude that the field of job recommendations is still unripe and require further improvements. As part of our ongoing research, we aim to build a new recommendation approach and test with real data for employee and staffing data from large companies.

12.FUTURE SCOPE:

Futureproof your CV by learning about the skills employers of tomorrow will most likely be looking for, and the online courses you can take to train up.

Important skills for future scope:

- Active learning
- Analytical thinking
- Complex problem-solving
- Communication

- Cognitive flexibility
- Emotional intelligence
- Leadership
- Technical design aptitude
- Creativity
- self-management

future important skill:

- becoming more adaptable
- adjusting to career changes and new environments
- succeeding in a variety of settings
- improving teamwork skills
- offering greater benefits to companies that hire you

A few high potential career options in India are:

1. Full stack software developer
2. Company secretary
3. Software engineer
